

Innovative Power Transmission

Slide Bearings Type **E**

Series **EF** Journal Range 80-355 mm

This leaflet contains information which should be considered for the majority of applications where EF-type bearings are used with electric machines. All the other facilities of the E-type bearing modular system will, of course, also apply to EF-type bearings: e.g. bearing shells with two- or four-lobe bore, with journal tilting pads or RD thrust pads. Relevant details will be found in the main catalogue on "RENK Slide Bearings Type E".

All parts of the variants mentioned in this leaflet are available from stock.

Bearing Housing

The finned EF-type housings are made from a high-quality cast iron (EN-GJL-300) and are designed for heavy duty performance. Other materials such as, for instance, nodular cast iron EN-GJS-400-15 or cast steel GS 45 can be supplied by special arrangement.

Bearing Shell

The shells are spherically seated in the housing. They consist of a supporting steel body lined with lead based RENKmetal therm 89/V6. Both design and manufacture are in accordance with the highest standards required in heavy engineering: trouble-free assembly and long life even under severe operating conditions.

EF-type bearings are mostly equipped with shells with plain cylindrical bore and lubricating oil ring. Shells are available either for self-contained operation (E.NL.) or prepared for external oil circulation (E.ZL.).

Apart from bearings without thrust parts (type...Q) there are shells with plain white-metal lined shoulders (type...B) to absorb limited noncontinuous axial loads, as well as shells with built-in taper land faces (type...K) which will absorb medium axial loads. Alternatively the taper land faces can be supplied suitable for only one sense of rotation (type...E) to absorb high axial loads.

Seals

EF-type bearings with floating labyrinth seals (type 10) are used for standard applications. They consist of a fibre-reinforced, highly heat resistant material RENKplastic therm P 50, and are not subject to wear. This seal conforms to protection grade IP 44. Higher protection grades (up to IP 56) can be fitted under the modular system.

To protect machines fitted with EF-type bearings against any interference from inside (e.g. vacuum or strong air circulation), EF-type bearings should be used generally only with additional "machine seals". Such seals are fitted to the inside of the machine end shield forming a sealing gap with the shaft.

RENK Hannover can supply a machine seal (made of a non-corrosive alloy). Optionally the air-tightness of this machine seal can be improved by inserting a hemp tallow packing in the standard circumferential groove of the seal.

The space between housing and machine seal is connected to atmosphere so that no vacuum or strong air turbulence can occur at the internal bearing seal.

Oil Supply

Self-lubrication by means of a loose oil ring for peripheral shaft speeds up to 20 m/s. The lubricating oil delivered to the internal perimeter is transferred by the loose oil ring directly to the shaft. Where bearings are lubricated by oil circulation systems, loose oil rings can be used with peripheral shaft speeds of up to 26 m/s to permit emergency shut-down without damage. Loose oil rings can also be used for marine applications. In this case additional guide bushes are built into the shells.

Electrical Insulation

As protection against stray currents conducted by the shaft, EF-type bearings can also be supplied in insulated version. To do so, the spherical bearing shell seating within the housing is electrically insulated by using a plastic shell firmly stuck to the housing or an insulating foil. All EF-type bearing housings "with spherical insulation" are available from stock.

Heat dissipation

Frictional heat is often dissipated merely by radiation and convection only: "natural cooling". Depending on the shaft diameter, speeds of up to 3600 min⁻¹ are admissible.

Because of their advanced design, EF-type bearings with natural cooling can now be used for a wide range of applications.

Oil coolers (with seawater-resistant finned cooler tubes) incorporated in the oil sump can be used in addition. Dimensions on request. EF-type bearing housings are generally suitable for connection to an oil circulating system.

In such case the oil level in the housing is defined by the weir in the oil outlet pipe of our supply.

Temperature Control

Two independent thermosensors which are commercially available can be used for temperature control. We recommend the use of RENK resistance thermometers or RENK angle thermometers for direct visual control.

Oil Selection

Generally any branded mineral oil of low foaming tendency and good resistance to ageing can be used as a lubricant. The correct viscosity for each operating condition should be checked by EDP calculation. Such calculations are carried out at the design stage. A printout of the results computed can be provided on request.

Dimensions of Bearings (DIN 31 694)

EF. LB
EF. LK
EF. LE

EF. LQ

- d_{1,4} = oil inlet if connected to oil circulating system or circulating pump
- d₁₅ = thermometer connection
- d₁₆ = oil level or oil outlet if connected to oil circulating system
- d₁₇ = screw plug for oil sump thermometer, suction line of circulating pump connection of heater (or modified for finned tube oil cooler optionally)

From bearing size 14 larger bore diameters are possible (information upon request).

¹⁾ Available only with shells B and Q.

²⁾ Diameter of finished surface of machine end shield.

- ① Type E
- ② Housing M = centrally flange-mounted
- ③ Heat dissipation
 - N = natural cooling
 - Z = lubrication by oil circulation with external oil cooling
 - X = lubrication by oil circulation with external oil cooling for high oil throughput
 - W = water cooling (finned tube cooler in oil sump)
 - U = circulating pump and natural cooling
 - T = circulating pump and water cooling
- ④ Shape of bore and type of lubrication*)
 - L = plain cylindrical bore, with loose oil ring lubrication
- ⑤ Thrust surface*)
 - Q = without thrust parts (non-locating bearing)
 - B = plain sliding surfaces (locating bearing)
 - K = taper land faces for both senses of rotation (locating bearing)
 - E = taper land faces for one sense of rotation (locating bearing)

*) = if not mentioned see main catalogue, details on request

Example

for quoting a slide bearing type EF, lubrication by oil circulation with external oil cooling, cylindrical bore with loose oil ring lubrication (for emergency operation), thrust part with taper land faces, size 14, shaft diameter 125 mm:

① ② ③ ④ ⑤

Slide bearing E F Z L K 14-125

The indicated weights are average values (not binding). The drawings are not strictly binding.

As for bearing types E.Z.L., the oil outlet with weir is to be mounted horizontally at the bottom. The mark at the flange will then be visible centrally at the top.

1) For shaft tolerances see "Manual for the application of RENK slide bearings".

2) Where a non-locating bearing is to permit greater axial movement (e.g. to allow for thermal expansion), the distance b₈ between the collars may be increased.

3) The normal axial clearance is 0,5 mm. When directional changes of thrust loads or where axial shocks are to be anticipated, the dimensions b₁₃ may be reduced by a further 0.3 mm.

Where a locating bearing is only required for a test run, the dimension b₁₃ can be

increased by 3...6 mm.

4) All diameters d₂₃ are for standard machine seals and are valid for each shaft diameter D. In case of rigid seals dimensions on request.

Tolerances of form and position to DIN 31 699.

Degree of accuracy B 10 (radial). Degree of accuracy B 20 (axial); others upon request. General tolerance DIN 7168 mS.

5) Rigid seal

Also available in split design.
